EASY IDENTIFICATION OF ILLUSTRATED KEY TO THE SPECIES OF GENUS CHLOROPHYTUM IN PUNE AND ADJOINING REGION

INTRODUCTION:
In the recent years there has been growing interest in plant diversity studies in general and floristic studies in particular. In this connection regional floristic studies are of much importance. It can be achieved by intensive exploration of smaller areas. Method includes, Field study, Herbarium study & Illustrations based on plant specimens. Besides the time consuming process of correct identification of plant species can be minimized, if such flora is easily accessible available at the nearest reference point.

In our study we have described illustrated key to the species of genus Chlorophytum There is stray floristic work on various talukas of Pune district. These floristic works i.e. the floras or check lists, very rarely provide illustrations, which is a easy mode of comparing, verifying and identification plants. The present work is a sincere attempt to provide an illustrative key to species depicting important morphological characters to identify the plants easily to give structural details especially of flower and fruit in a comparable format. The main purpose was A depiction of the habit, alongwith finer structural details of flowering and fruiting condition. The specimen is herbaceous, always include enough of the underground parts to show their characters.

MATERIALS AND METHOD
The present work is based on the result of extensive explorations to study the species of genus Chlorophytum in pune and adjoining region. The study was undertaken by Field study , Herbarium study , Illustrations based on plant specimens. Pune and adjoining regions mentioned as above is approachable by own vehicle during all seasons. A major bulk plants of collected in rainy seasons because majority of the flowering plants found in rainy reasons and especially some ephemeral plants are only found in monsoon period.

While collecting the specimens, the data such as habit, habitat, flower colours, fragrance if present, frequency of distribution, local names and uses, if any were recorded in the field itself. Besides the wild species, some cultivated plants, weeds of cultivated field and road sides have also be collected. These specimens collected were pressed in the field using blotting paper and old newspaper. The flowers of some of the species which were of some botanical interest were fixed in 4% formalin for further studies in the laboratory. These specimens have been deposited in the herbarium of University of Pune, Department of Botany, Pune-411 007. Generally 3-4 specimens of the each plant were collected. Two specimens were mounted and others were treated as duplicate specimens.

Preparation of Herbarium sheets was done carefully collected taking care that the specimens are healthy, free from evidence of insect feeding, rust infections, and other obvious pathological symptoms. It was ensured that the specimen is either in flowering or fruiting condition. The specimen is herbaceous, always include enough of the underground parts to show their characters.

Herbarium sheets were treated as duplicate specimens. Two specimens were mounted and others were stitched wherever necessary with help of cotton thread.

The plant specimens pressed on the spot and some time collected in vasculum and pressed after coming to laboratory. While collecting the specimens, the data such as habit, habitat, locality, local name, etc. have been immediately recorded in the field diary. After returning to the laboratory, the plant specimen have been pressed in between the sheets of blotting paper. One plant should be arranged, on one sheet in a manner that there should be no over lapping of parts. The large size specimens have been folded in 'V, Z, W' 'C' shape. The blotting papers with plant specimens have been placed in field press for about 24 to 48 hrs. The press is then opened, blottings have been changed and rearranged the plant specimen properly. This practice made continuous for 10 to 15 days till the specimens get properly dried.

Poisoning of the specimen have been done immediately after collection; all the specimens were poisoned in aqueous solution of Mercuric chloride and dried using standard herbarium techniques. After drying, the specimens were mounted for permanent record on herbarium sheets. The herbarium sheets of standard size 42 cm X 28 cm; and such standard herbarium sheets have been used. The specimens were mounted on the sheets with the help of glue or by stitched wherever necessary with help of cotton thread.

METODOLOGY OF ILLUSTRATIONS
The main purpose was A depiction of the habit, alongwith finer structural details especially of flower and fruit in a comparable format. Thus the details depicted are taxonomically significant. Following the general pattern of one plate per species, the first step was to visualize the number of sketches involved and scale suitable to the illustration i.e. reduction of larger organ and enlargement of smaller ones.

Depiction of the twig as visual aid to recall the plant characters is important. Thus special efforts were made to make the habit sketch and

KEYWORDS
Illustrated Key, Genus Chlorophytum, Pune And Adjoining Region
A photograph of the specimen from the same collection was most useful in rounding off the habit sketch. To satisfy this purpose an extensive field work was carried out in the study area in various seasons to capture the flowering and fruiting season of plants.

The plant parts were detached from the twig, and examined under a binocular dissection microscope under suitable magnification (X5 or X10 is usually sufficient). Almost all the details were studied. Serial sketching of structure in order (Calyx, Corolla, Androecium, Gynoecium, Fruit) with detail was done. All the sketches were drawn with fresh specimen and with hand by using isograph drawing pens with zeichentusche drawing ink on A4 size bond paper and scanned for further DTP work in Photoshop, then it was inserted is MS-word and edited for labeling, numbering and preparation of keys. The sketches were made first with pencil, with suitable scale (X5) in case of minute flowers the magnification was X2-X20 times of the original specimen. In case of large specimen five to twenty times reduction was done. All the sketches are calibrated and suitable magnifications have been shown near the sketch.

The advantage of keeping the same scale of magnification/reduction for comparable structure within the taxon or for all the species enables us to emphasize the actual scale of various plant parts.

From the printed plate, which usually gets reduced in size during DTP or printing it is possible to compute back the original values, both of the sketch and the actual material. The sketches aim to convey maximum information for which all parts are illustrated: habit, flower, calyx, corolla, stamen (front and back view), pistil, ovary (V.S. and T.S.), fruit and seeds. Scale is individually given to all figures.

The genus Chlorophytum in Pune and adjoining region was arranged in the modified Bentham and Hookers system of classification, followed in India. Within genera the species are given in alphabetical order. An index gives the names of genera and species as well as vernacular names.

The discriminating morphological character is placed below the description in form of the actual sketch of the selected character in the indented key element. An index gives the names of families genera and species as well as vernacular names.

The species Chlorophytum tuberosum is a Herbs, c 30 cm high; root – fibres cylindrical, with ellipsoid tubers hanging from them. Leaves 6-12, membranous, sessile, 15 -30 x 1.5 – 2.5 cm shorter than scape, usually falcate, flat or folded, acute at apex, glabrous, with numerous inconspicuous nerves. Inflorescence very slender, flexuous. Scape 2.5 – 8.0 cm long, naked. Racemes 7.5 – 25.0 cm long, bracts 1.5 cm long. Flower greenish – white. Perianth hyaline, 3 -nerved, 3.5 - 4.0 x 1.5 mm long, oblong obtuse. Stamens unequal; style 1.0 mm long. Placationt axe. Capsule 1.2 – 3.0 x 0.5 cm, broadly obcordate, 3 – winged. Seeds 1 -4, c 0.3 cm across, irregularly angled, black, minutely papillose. Very common in grassland with great variation in leaf size, shape. It is found Pune University campus, Katraj Ghat.

Chlorophytum laxum is Herbs, c 30 cm high; root – fibres cylindrical, with ellipsoid tubers hanging from them. Leaves 6-12, membranous, sessile, 15 -30 x 1.5 – 2.5 cm shorter than scape, usually falcate, recurved, acuminate, margins undulate. Inflorescence raceme, 7.5 – 30.0 cm long ; scape , terete, naked. Flower white ; perianth lobes 1.0 x 0.4 cm long, oblong– lanceolate, subacute, 7-9 nerved. Stamens c 0.8 cm long; anthers 0.4 – 0.5 cm long; narrowly linear, stigma minute. Placentation axile. Fruits capsule, c 1.0 x 0.6 cm, shining, obovoid, transversely veined, emarginate. Seeds 4 - 6, irregularly orbicular, c 0.3 – 0.4 cm diam, black. Fls. & Frts. is found in June – September. Common in grassland and located at Katraj ghat, Sinhgad.

Thus due to different uses of these plants of the same genus it is necessary to correct identify them which is possible with the help of our illustrated keys. This work will provide a practical introduction to the techniques of documentation in taxonomy to study the plant genetic resources. Besides the time consuming process of correct identification of plant species can be minimized, if such flora is easily accessible available at the nearest reference point. Instead of wasting time and paying heavy fees which such institute ask for identification, one can easily go through the illustrative keys and identify the plant, within no time. Therefore such kind of floras are need of time today and in future.
